TWENTY-SECOND REPORT

OF THE

BOARD OF SUPERINTENDENCE OF THE DUBLIN HOSPITALS.

TO HIS EXCELLENCY FRANCIS THOMAS EARL
COWPER, K.G.,

Lord Lieutenant-General and General Governor of Ireland,
dec., dec., dec.

2nd November, 1880.

MAY IT PLEASE YOUR EXCELLENCY,

We, the Board of Superintendence of Dublin Hospitals, have the honour to submit to your Excellency this our Twenty-second Annual Report and Statistical Returns for the year ended 31st March, 1880.

During the above period we have inspected the several Hospitals in this city which receive Parliamentary grants.

These are :—

1. Westmorland Lock Hospital.
2. The House of Industry Hospitals, viz. :—
 - a. Hardwicke Fever Hospital.
 - b. Whitworth Medical Hospital.
 - c. Richmond Surgical Hospital.
3. Steevens's Hospital.
4. Meath Hospital and County Dublin Infirmary.
5. Cork-street Fever Hospital.
6. Rotunda Lying-in Hospital.
7. Coombe Lying-in Hospital.
8. St. Mark's Ophthalmic Hospital; and
9. Hospital for Incurables, which receives a portion of the Concordatum Fund.

On these occasions we made careful inquiries as to the state and condition of each institution, its management and extent of accommodation; we visited the wards and other parts of the buildings to observe their condition, and the care and attention bestowed on the patients. We examined the dietaries in use, and the manner of serving the food to the patients, and inquired respecting such other matters as might assist us to supervise these institutions, and to report thereon in accordance with the provisions of the 18th section of the Act 19 & 20 Vic., cap. 110.

In the Appendices annexed are submitted a series of tabular statements which show the statistics of each Hospital in respect to income and expenditure, the number of patients treated, and the results, together with the average cost per bed occupied in each Hospital.

THE WESTMORLAND LOCK.

On inspection we found the wards and other parts of this institution clean and well ventilated. The bed clothes of the patients were in good condition, and neatly arranged, the floors were well scrubbed, and the appearance of the whole showed management highly commendable. The patients appeared to be carefully attended to, and due discipline and regularity are evidently maintained.

We ascertained that no visitors are admitted to any of the wards except the immediate relatives of the patients, and then only in presence of the Matron. The Laundry department of the Hospital continues to be used as a kind of reformatory establishment, where the better disposed class of discharged patients are employed. This Hospital receives no aid beyond the Government grant, though the special purpose of its functions is, perhaps, the most important for which provision can be made, not only to the community, but the State. Its utility may be gathered from the fact that during the past year 793 intern patients were treated in the wards.

On the 1st April, 1879, 77 patients remained under treatment; 709 were admitted; 7 infants were born in the Hospital; 730 patients were discharged; 10 died; and 53 remained on the 31st March, 1880.

The time spent in Hospital by each patient averaged 28.99 days. The average daily number of beds occupied during the year was 62.80 and the mortality was 1.35 per cent.

STEEVENS'S HOSPITAL.

We inspected this institution, accompanied by some of the Governors and Medical Officers. We found the patients well attended to, the changes of linen sufficient, the different descriptions of food, which we examined with considerable care, good, and the cooking satisfactory.

During the year the drainage has been remodelled, and glazed pipes substituted for the old rubble masonry sewers. A new bath has been placed in the upper story for the benefit of the constabulary patients, and the entire woodwork of the Hospital has been painted.

The services of a lady superintendent of nurses from St. Thomas's Hospital, London, have been secured, and new arrangements have been made for conveying the patients' food from the kitchen to the wards. With the view of preventing the spread of disease in connexion with the epidemic wards, we recommended on several occasions that a chamber should be appropriated for stoving or purifying the clothes of fever patients. At our last visit we observed with regret that an arrangement so important and inexpensive remained unattended to.

The lavatories and some of the water-closets are still defective but we have been informed that the present financial condition of the institution prevents any further outlay for improvements.

The grounds on which the Commissioners of 1855 felt justified in recommending an increased grant, are stated to be that of securing the establishment of a Medical School in connexion with this Hospital. Till recently this condition had been complied with, but we have been informed that during the past year the Medical School has ceased to exist, and no connexion has been formed with any kindred educational establishment to supply its place. Having regard to the condition on which the grant was made, and with the view of obtaining further information on this subject, we addressed the following letter to the Governors of the Hospital, which we insert with the reply :—

“ Board of Superintendence of the Dublin Hospitals,

“ Office, 35, Dawson-street,

“ 5th November, 1880.

“ SIR,—Referring to your communication of the 10th July, informing the Board of Superintendence that the Medical School in connexion with Steevens's Hospital had been closed, I am directed to invite the special attention of the Governors of Steevens's Hospital to the Report of the Hospitals' Commissioners of 1855, and to the grounds on which they recommended an increased grant of £220 a year to this Hospital. I am to request that the Governors will be so good as to favour the Board of Superintendence with their views as to the expediency of re-opening the Medical School, so as to qualify the Hospital for this increased grant.

“ I am, sir, &c.,

“ W. J. MARTIN, *Secretary.*

“ R. B. M'Vittie, Esq., Registrar, Steevens's Hospital.”

“ Doctor Steevens's Hospital, Dublin,

“ 18th day of November, 1880.

“ SIR,—In reply to your letter of the 5th November, I am directed to say that the most careful consideration has been given to the Report of the Commissioners, and to the objects for which the institution was founded, and that taking everything into consideration, especially the limited space on which the institution is founded, the Governors do not consider it for the interest of the Hospital, or the due care of the patients, to have a school attached to the institution.

“ I am, sir, yours, &c.,

“ R. B. M'VITTIE, *Registrar.*”

The conflict of opinion which appears to exist between the Board of Governors of this Hospital and the Commission which recommended the Parliamentary grant, renders it our duty to solicit the attention of your Excellency to the circumstance that a Select Committee of the House of Commons in 1854 recommended a grant of £1,080 to Stevens's Hospital, that that sum

was increased to £1,300 on the recommendation of a Commission appointed in 1855 by the then Lord Lieutenant of Ireland, and that this increase appeared to a great extent to be conditional upon the establishment and maintenance of a Medical School in conjunction with the Hospital.

It will be for your Excellency to consider whether the recently expressed views of the Board of Governors on the subject of continuance of the Medical School are in accordance with the conditions upon which the increased grant was sanctioned.

We feel constrained to place on record our dissent from the views of the Board of Governors of Stevens's Hospital, and it appears to us that it might be desirable that your Excellency would be pleased to afford the Governors an opportunity for reconsidering the subject, either through the medium of a direct communication addressed to that body or by means of an inquiry specially ordered, at which the Governors would be allowed more fully to explain the grounds upon which they resolved to close the Medical School.

During the past year 2,254 patients were treated in this institution; 2,129 were admitted; 2,105 discharged; and 105 remained on the 31st March, 1880. The average number of beds occupied daily was 135.28, and the time spent in hospital by each patient averaged 21.96 days.

44 patients died during the year, giving a mortality of 2.04 per cent. on 2,149 cases treated to a termination.

MEATH HOSPITAL.

The patients' comforts are fully provided for, and the internal arrangements of this institution appear to be carried out with due order and economy. A careful inspection showed that the food was good, and the mode of preparing it moderately cheap. There appears to be a great disproportion between the necessities of this Hospital and its resources. The ward furniture requires to be renewed, and the faulty position of the water-closets referred to in our previous Reports remains unremedied. We again beg leave to state our opinion, that there can be no safety for the sick if water-closets are not built external to the main building, and approached from the wards by corridors suitably lighted and ventilated.

The position of the Post-mortem Room (underneath the Operating Theatre) and its general arrangements are most objectionable; we suggest its removal to some contiguous building. The substitution of glass for porcelain bed urinals at present in use, would in our opinion be an improvement; for the smallest imperfection in the glazing of porcelain favours the deposition of organic matter, rendering the vessel offensive and difficult to clean.

During the past year there has been a marked falling off in the number of admissions, owing to the want of sufficient funds to maintain the usual number of beds. Ninety-one patients remained in Hospital on the 1st April, 1880; 1380 were admitted during the year; 1308 were discharged; 71 died, and 92 remained on the 31st March, 1880.

The time spent in Hospital by each patient averaged 21·65 days. The average daily number of beds occupied during the year was 87·5 and the mortality was 5·14 per cent.

CORK-STREET.

The general impression left on our minds after inspecting this institution was favourable to its management and internal arrangements.

The entire hospital has been recently painted both externally and internally, new iron entrance gates have been erected, and other minor improvements effected. The Committee again acknowledge the efficient and unremitting attention of the Registrar and Lady Superintendent, and testify to the general good conduct of the nurses and servants.

We learn from Dr. Harvey's Medical Report, which is most instructive and suggestive, that during the year there has been a marked diminution in the number of cases of typhus, enteric and simple fever. There was no case either of relapsing or of intermittent fever. The number of small-pox patients, amounting to 600, while forming more than one-half of the total number of admissions, was but two-fifths of the preceding year's number, or in other words, showed a falling off of 909.

Measles also showed a decrease of 5. The most marked increase is to be found under the heads of scarlatina and pneumonia, being in each case 27. This brought the total number of admissions in scarlatina to 98. The disease was of a bad type, and the mortality reached 27·5 per cent.

On referring to the classified list of diseases it will be perceived that 115 patients not suitable for admission to fever wards were under treatment during the year. This occurrence is owing to the extreme difficulty which frequently is experienced in discriminating in the early stages cases of true fever, scarlatina, &c., from those diseases which resemble them; patients are often sent under such uncertain conditions to fever wards and exposed to the contagion of a disease they had not at the time contracted. We have been informed that the Governors have under consideration the project of opening observation wards, where all doubtful cases may be placed until the true nature of the disease becomes evident. Thus the risk of exposing such patients to contagion would be lessened.

Though care has been taken to isolate in separate buildings the small-pox patients; yet six cases of scarlatina about a fortnight after admission, were attacked by small-pox; and similarly seven small-pox cases were attacked by scarlatina.

There were 75 patients in the institution at the commencement of the year; 1083 were admitted; 892 were discharged; 186 died, and 80 remained on the 31st March, 1880.

The mortality was 17·25 per cent. on the total number treated to a termination.

The time spent in Hospital by each patient averaged 21·87 days, and the average daily number of beds occupied through the year was 69·28.

HOUSE OF INDUSTRY (HARDWICKE, WHITWORTH, AND RICHMOND)
HOSPITALS.

On inspection of these Hospitals we found the wards orderly, well ventilated, and the patients seemed to be properly attended to. The different articles of clothing and bedding in use were branded with the hospital stamp, an arrangement which tends to prevent the loss of property, and facilitates its being traced if purloined.

We observed that each ward had its due proportion of shawls or cloaks for the use of the sick in cold weather. The sewerage is said to be effective, with ample provision for flushing.

The registry of patients and the several diet and account books, &c., are carefully and accurately kept.

HARDWICKE.

Fearing that contagious diseases might be spread by the admission of visitors to the wards, the officers in charge have been instructed to do all in their power to dissuade the friends of small-pox patients from visiting the epidemic wards. The Governors have also issued the following regulation :—

“That no person can be admitted to see patients in small-pox, typhus, or scarlet fever, except with a written order from the physician attending the patient; that this permission be confined to the nearest relatives; that the visit be limited to fifteen minutes; and that the dress of the hospital be worn by the visitors in lieu of their own clothes.”

It is satisfactory to note that no case has been reported during the year of any person who in consequence of visiting sick friends in the wards contracted infection, or became the medium of conveying it to others.

Thirty-seven cases of alcoholism in various phases were treated in this hospital, and in no instance did any one of these patients contract an infectious disease. We are, however, of opinion that there is a certain amount of risk in treating such patients in a fever ward, but the danger is in proportion to the over-crowding, deficient ventilation, and the accumulation of infected cases. In this Hospital, no special ward is set apart for the reception of cases of this kind. In last year's Report we referred at some length to the great disadvantage of the prevailing system of admitting patients suffering from alcoholic delirium to general wards; and as nothing has been done towards carrying out our suggestions, we again humbly submit this subject for the consideration of your Excellency.

Forty patients remained in this Hospital on the 1st April, 1879; 1035 were admitted during the year; 857 were discharged; 170 died, giving a mortality of 16·55 per cent. on the total number of cases treated to a termination. The average daily number of beds occupied through the year was 48·29; and the time spent in Hospital by each patient averaged 16·44 days.

WHITWORTH HOSPITAL.

On the 1st April, 1879, sixty-six patients remained in this Hospital; 791 were admitted, in addition to 2 born in the wards; 735 were discharged; 68 died, giving a mortality of 8·46 per cent. on the total number of cases treated to a termination. The average daily number of beds occupied through the year was 52·68, and the time spent in Hospital by each patient under treatment averaged 22·44 days.

RICHMOND HOSPITAL.

In our Twentieth Report we considered it our duty to point out "that the dead-house in which the autopsies are made, is "placed directly under the seats of the operating theatre. It is "obvious that this is a most unsatisfactory arrangement, and "that the success of surgical operations is gravely imperilled by "being performed in an atmosphere subject to such contamination." The inexpediency of such an arrangement is so evident that we should have thought it only necessary to advert to it, to insure its being immediately remedied. We observed, however, on our last inspection that no steps had been taken to remove so mischievous a nuisance.

At our suggestion a commodious reception room has recently been provided for extern patients, and the arrangements for the treatment of these cases are well carried out.

The extensive and pestilent dairy yards in close proximity to the hospital walls still remain contaminating the atmosphere, and are consequently injurious to the patients.

There were 160 patients in this Hospital when the year commenced; 934 were admitted; 908 were discharged; 32 died, giving a mortality of 3·40 per cent. on 940 cases treated to a termination.

The average daily number of beds occupied in the year was 82·95, and the time spent in Hospital by each patient averaged 29·36 days.

ROTUNDA.

The patients' comforts are carefully considered, and great care is bestowed on cleanliness and ventilation. Since our last visit the Dublin Corporation have conferred a boon on the patients by laying down wood pavement in Britain-street, opposite the hospital.

The financial position of the institution having improved the Governors state they have been enabled to carry out several alterations which they long desired to effect, and which they are of opinion will contribute to the well-being of the patients. With this view, they have erected a shed opened at the side, which will enable the bedding and the bed clothes used by the patients in the wards, to be hung up and thoroughly aired in all weathers. There is also in process of erection a hot air chamber, which will be used for disinfecting purposes when necessary. The Governors trust these precautions will prove of great benefit to the Hospital.

The mortality during the past year has been in excess of that of the previous one. This appears to the Governors of the Hospital to have been due to two causes—1st, the unhealthy condition of the patients; and, 2nd, the increased number of unmarried women who seek admission for their confinement. As is well known, the mortality among the latter class of persons is always very large. The high rate of mortality which has prevailed in Dublin during the past year has necessarily affected this Hospital, and the number of women admitted in an unhealthy state was comparatively great. Not a few of those who died were found to be seriously ill when admitted. No fewer than nine women known to be unmarried died during the year, and either gave feigned names or incorrect addresses, and as their friends could not be found, they had to be buried at the expense of the Hospital.

Considering the predisposition of this class of patients to septicaemia and other fatal diseases, and the extreme danger of contagion extending to other labour cases in the Hospital, we suggest for the consideration of the Governors the expediency of having unmarried women confined in a separate building set apart for that purpose.

We recommend that a room detached from the Hospital be appropriated for soiled linen. The present arrangement of conveying it from the wards to the basement story, previous to its being removed to the laundry, is objectionable, as emanations arising from soiled clothes heaped up as we found them on the day of inspection, are likely to be carried back through the hospital, and to become injurious to the patients.

We are of opinion also that it might be advisable to remove all soiled linen from the wards in covered baskets lined with some impervious material, such as zinc.

During the past year 16 patients had been transferred from the labour wards to the Auxiliary Hospital, 11 of whom had been previously delivered within from nine to thirty days of death. On the 1st April, 1879, there were 30 patients in the labour wards; 1,369 were admitted during the year; 1,173 were discharged after delivery; 201 were discharged, not being in labour; 27 died; and 25 remained in the Hospital at the close of the year. Twenty patients affected with diseases peculiar to women remained in the Auxiliary Department on the 1st April, 1879; 424 were admitted; 393 were discharged; 24 died in the year ended 31st March, 1880, and 27 then remained.

The mortality of the labour patients, deducting the 201 non-parturient cases, was 2·30 per cent, and that of the chronic class 5 per cent.

We consider it our duty to make some observations upon the very high death-rate amongst the labour cases, and still further, to urge the necessity of home attendance to the widest extent. We find, however, that this death-rate is not strictly accurate, for women who become very ill after confinement are, as soon as possible after the eighth day, removed to the Auxiliary Hospital, where, if they die, their demise is not credited to the lying-in department.

The average daily number of beds occupied through the year by labour patients was 29.59; by chronic cases, 23.24. The time spent in Hospital by labour patients was 7.74 days; by the chronic class, 19.15 days.

COOMBE.

We found this Hospital on inspection to be scrupulously clean, the floors were well scrubbed, and every provision appeared to be made for the treatment and comfort of the patients. We are of opinion, however, that the beds allotted to labour-patients were too closely placed. Considerable expense appears to be incurred in the management of this institution—the average cost per bed occupied throughout the year for maintenance and for establishment, exclusive of buildings and furnishing such buildings, being £89 6s. 2d., against £94 13s. 11½d. the preceding year. The attention of the Guardians and Directors having been directed to this subject, we have been informed that the patients belonged to the labouring classes, who, owing to the long-continued frosts, and otherwise severe weather and general depression of trade, had not recently the opportunity of earning sufficient to provide an adequate amount of nourishing food. The patients admitted were very destitute, and as their vital conditions were much lowered, it was consequently necessary to give more food and stimulants than during the previous years. For the same reasons it was absolutely necessary to give food and wine to many of the out-patients who were attended from the hospital, and for which no credit was taken in the accounts.

We have expressed our opinion to the Guardians and Directors that a large expenditure on food and wine for extern patients is contrary to the intentions of Parliament, and not in accordance with the practice of other hospitals. We also consider it our duty to express our disapproval of the hospital authorities not having kept a separate and detailed account of such expenditure. At our suggestion a book is now kept in which the kind and quantity of diet and stimulants ordered specially from day to day for such out-patients are recorded.

On the 1st April, 1879, there were 5 patients in the labour wards. 552 were admitted during the year. Of these 490 were discharged after delivery; 52 were discharged not being in labour; 12 died, being at the rate of 2.39 per cent.; 3 remained in the Hospital at the close of the year. In the chronic wards 21 patients affected with diseases peculiar to women were present at the commencement of the year; 104 were admitted, and 4 died, giving a mortality of 3.57 per cent.

The average number of beds occupied by chronic patients was 9.66, and of labour cases 9.58, and the stay of the latter in Hospital averaged 6.29 days, while the former averaged 28.29 days.

INCURABLES.

This institution appears to us to be well conducted; it has evidently won the confidence of the benevolent, and appeals to a very wide circle of our sympathies. It not only alleviates the miseries of the poor patients, but also relieves their homes and families from the pressure of a great burden.

One hundred and sixty-one patients remained in Hospital on the 1st April, 1879; 56 were admitted; 6 discharged; 54 died during the year, and 157 remained on 31st March, 1880. The mortality was 90 per cent. on the total number treated to a termination. The time spent in Hospital by each patient averaged 266·75 days. The average daily number of beds occupied throughout the year was 157·75.

ST. MARK'S.

We are happy to reiterate the statements made in our last Report respecting the efficient condition of this Hospital. From the returns we learn that during the past year 474 patients were admitted into and treated in this hospital, in addition to 20 remaining from preceding year. Of these 462 were discharged totally cured or relieved, whilst no death is recorded.

The medical statistics are carefully compiled, and form a satisfactory record of the way in which the work is done. On the 1st April, 1879, 20 patients were in Hospital; 474 were admitted during the year; 462 were discharged; 32 then remained.

No death occurred during the year.

The average daily number of beds occupied was 27·07, and the time spent in Hospital by each patient averaged 20 days.
